

For Main Functionality:

Story #1: We allow the same username for a student and an admin, but we don't allow the same username for two students and two admin, like two student both called 'test'. We give the restriction for this.

Story #2 and #4: We wanna know why we have 4/5 and 0/4 for story 2 and 4 and there are no comments. Especially for story #4, we get zero for it.

Story #5 and #9: We give the restrictions for the event management based on start time and end time to differ the different functions that users can operate on different event status:

Here is the logic:

- Student can give RSVP for the event hasn't start, which hasn't reach the start time. Once the student give the RSVP. The event been RSVP will appear in scheduled event for giving feedback after the event finished and tracking the update. Also the participant limit space will decrease correspondingly.
- Student can give feedback for the event has ended. A event is ended means that the start time and end time of the event has been passed.
- The aim for these restrictions is to limit who can give feedback. The logic is that we want make only the student who attend the event (RSVP) can give the feedback. Our target is to make the logic for feedback more reasonable, and make these feature more complete. Truly, it will make more steps for testing, but I don't think it will be a big trouble for users.

Story #8: Each event posted has it unique id for differing. We consider that probably there is the situation for posting event with same title, content or date. So we didn't give the restriction. It depend on admin whether to post the event with same name. But each event is unique based on its `infoID` backend,

For User Interface Design: Back

Back Button logic: All the back button use the finish() method in android studio. When you use the back button in an activity, that activity is destroyed and removed from the activity stack, and thus you will return to last page that you see. For POST Checker feature, consider this situation, we give the return to dashboard button to quickly back to the dashboard, avoiding the situation that when finish the questionnaire, user need to click back button multiple times to back to the dashboard.

Time Logic Bug Explanation:

When creating and editing the event, we give the restriction that the end time cannot be before the start time with the following code:

```
private boolean validateDateTime() {  
    if (startDateTime.after(endDateTime)) {  
        Toast.makeText(this, "End date and time must be later than start date and time",  
            endDateTimeEditText.setText("");  
        return false;  
    }else{return true;}  
}
```

Where `startDateTime` and `endDateTime` are both `Calendar`

But probably because `startDateTime` and `endDateTime` initialize as the current time. As a result, if user use the current time as end time, it can get around the limitation.....

And for testing, we can adjust both start time and end time to make the event be finished and give the feedback. But if we only adjust the end time with this bug and the start time hasn't passed. The event won't be considered as finished and we can give feedback and view the feedback.
